

## Winpos MegaStore® - Application workflow

Set of applications are installed to each installment of the system, and applications are activated as "services" running in the background. Main User Applications are Front-End POS application "Registration" and Back-End POS application "BackOffice".

Each Sub Application has its purpose and can be activated based on the nature of the installment, and purpose of the installed unit of the system.

Applications use internal API calls and RDM.dll to communicate with SQL database engine, and COM-interface to communicate with Report Viewer application.

### Applications and Sub Apps
